Name of the Guide		Kalidindi Bhavya Varma

Abstract

The **AI-Based Library Management & Recommendation System** is a smart platform designed to automate and simplify common library operations. It provides a centralized system for managing books, student records, borrowing, returns, due dates, and book availability, reducing manual effort and improving accuracy. The system allows students and library staff to easily search and access information about available books. Students can view their borrowing history, track due dates, and receive notifications for upcoming returns. Librarians can efficiently manage book records, user accounts, and transactions through an organized interface. An **AI-based recommendation module** analyzes users' reading history, interests, and preferred genres to suggest books that match their preferences. Machine learning techniques can be used to identify patterns in borrowing behavior and provide personalized recommendations.

Overall, the system combines **library management with AI-driven personalization** to improve the user experience and resource utilization. It can help libraries make better decisions regarding book demand, popular categories, and future resource acquisition while providing users with a more convenient way to discover and access books.
